What is Crypto Market Cap?

Crypto market cap is the total value of all the coins of a particular cryptocurrency that have been mined or are in circulation. Market capitalization is used to

This website uses cookies for functionality, analytics and advertising purposes as described in our [Privacy Policy](#). If you agree to our use of cookies, please continue to use our site.

OK

market cap is calculated by multiplying the total number of coins in circulation by its current price. For instance, to calculate the market cap of Ethereum, all you need to do is multiply the total number of Ethereum in circulation by the current price of one Ethereum and you will get its market cap.

How to compare Cryptocurrencies Market Cap?

Crypto market cap can be divided into three categories:

- Large-cap cryptocurrencies (>\$10 billion)
- Mid-cap Cryptocurrencies (\$1 billion - \$10 billion)
- Small-cap cryptocurrencies (<\$1 billion).

As a financial metric, market cap allows you to compare the total circulating value of one cryptocurrency with another. Large cap cryptocurrencies such as Bitcoin and Ethereum have a market cap of over \$10 billion. They typically consist of protocols that have demonstrated track records, and have a vibrant ecosystem of developers maintaining and enhancing the protocol, as well as building new projects on top of them. While market cap is a simple and intuitive comparison metric, it is not a perfect point of comparison. Some cryptocurrency projects may appear to have inflated market cap through price swings and the tokenomics of their supply. As such, it is best to use this metric as a reference alongside other metrics such as trading volume, liquidity, fully diluted valuation, and fundamentals during your research process.

How does CoinGecko Calculate Cryptocurrency Prices?

The price is calculated using a global volume-weighted average price formula which is based on the pairings available on different exchanges of a particular crypto asset. For examples and more detailed information on how we track cryptocurrency prices and other metrics, see our [methodology page here](#).

Why are Cryptocurrency Prices Different on Exchanges?

You may notice that cryptocurrencies listed on different exchanges have different prices. The reasons for this are complex, but simply put cryptocurrencies are traded on different exchanges and across different markets with varying economic conditions, liquidity, trading pairs, and offerings (e.g. derivatives / leverage) which all influence price in their own way.

Where to Check Cryptocurrency Prices?

You can track over 10,000 crypto prices on CoinGecko across more than 50 currencies. Popular cryptocurrency pairs include [BTC-USD](#), [ETH-USD](#), and [SLP-PHP](#). You can also track metrics such as 24 hour trading volume, market capitalization, price chart, historical performance chart, the circulating supply, and

comprehensive information on chain charting tool featuring live charts, current trades, market sentiment and more as it happens in real time! CoinGecko also has a mobile app that enables you to track cryptocurrencies on [Android](#) and [iOS](#).

What is 24h Volume in the Table Above?

The 24h trading volume refers to the amount a cryptocurrency has been bought and sold on all exchanges within the last 24 hours on the spot market. For instance, if the 24h volume for Ethereum is \$15 billion, it means that \$15 billion worth of Ether had changed hands across all exchanges in the last 24 hours.

CoinGecko provides a fundamental analysis of the crypto market. In addition to tracking price, volume and market capitalisation, CoinGecko tracks community growth, open-source code development, major events and on-chain metrics.
